

**Claims**

**What is Claimed is:**

1. A system for cleaning, comprising:  
  
a handle; and  
  
a head having a cleaning surface, connected to the handle;  
  
wherein the head is extendable to selectively widen the cleaning surface.
  
2. The system of claim 1, wherein the head is contractable to selectively narrow the cleaning surface.
  
3. The system of claim 2, further comprising:  
  
a gear, connected to the handle and operably connected to the head, so that twist of the handle rotates the gear;  
  
wherein rotation of the gear selectively extends the head to selectively widen the cleaning surface.
  
4. The system of claim 3, wherein the reverse rotation of the gear selectively contracts the head to selectively narrow the cleaning surface.
  
5. The system of claim 4, further comprising:

a first series of extension gears operably connected to the gear;  
a first head extension operably connected to the first series;  
a second series of extension gears operably connected to the gear;  
a second head extension operably connected to the second series; and  
wherein twist of the handle rotates the gear, causing rotations of the first series and the second series, causing the first head extension to laterally extend and causing the second head extension to laterally extend.

6. A system for cleaning, comprising:  
a handle;  
a head connected to the handle; and  
a plurality of bristles connected to and extending from the head;  
wherein the plurality comprises individual bristles having varied cross-sectional shapes.

7. A system for cleaning, comprising:  
a handle;  
a head connected to the handle;  
a plurality of bristles connected to and extending from the head; and  
an anti-static material of individual ones of the plurality.

8. The system of claim 6, further comprising:

An anti-static material of individual ones of the plurality.

9. A system for cleaning, comprising:
  - a handle;
  - a head connected to the handle; and
  - a head cover, slidably engageable with the head, for providing different cleaning function than the head.
10. The system of claim 9, wherein the head cover includes a squeegee blade.
11. The system of claim 9, further comprising:
  - a head extender, connected to the head and operable in response to twist of the handle.
12. The system of claim 11, further comprising:
  - a head contractor, connected to the head and operable in response to twist of the handle.
13. The system of claim 11, wherein the head cover is slidably engageable with the head and the head extender, to cover the head and the head extender, providing a larger cleaning surface of the head cover.

14. A method of cleaning, comprising the steps of:
- grasping a handle;
  - moving the handle to move a cleaning head connected to the handle; and
  - selectively widening and narrowing the cleaning head.
15. The method of claim 14, where in the step of selectively widening and narrowing includes the steps of:
- twisting the handle in a direction with respect to the cleaning head to widen the cleaning head; and
  - twisting the handle in a different direction with respect to the cleaning head to narrow the cleaning head.
16. A system for cleaning, comprising:
- a handle;
  - a cleaning head, having a central portion and dual extension portions, connected to the handle;
  - wherein the dual extension portions of the cleaning head are pivotally connected to the central portion of the cleaning head; and
  - opposing asymmetric gears, engagingly connected to the central portion and to respective ones of the dual extension portions, to actuate respective ones of the dual extensions into laterally extended positions on opposing sides of the central portion in order to extend the cleaning head.
